Day 09 Student Notes Overview

Geometry Summer Credit | Similar Triangles in Diagrams and Contexts

Name:	Date:	Period:

Today's Big Ideas
- Mark corresponding angles and sides before writing a proportion.
- Similar triangle problems are usually scale factor and proportion problems.
- Shadow, map, photo, and coordinate problems still require matching parts.

Skills I Need to Practice	Vocabulary
- Identify corresponding sides in the same order. - Set up and solve proportions from similar triangles. - Find scale factor in diagrams, coordinates, and real contexts. - Explain why a proportion matches the diagram or context.	- similar triangles, scale factor, corresponding sides - corresponding angles, proportion, dilation - shadow problem, map scale, enlargement

Quick Reference	Watch Out For
- Step 1: mark the matching parts. - Step 2: write ratios in the same order. - Step 3: solve the proportion. - Scale factor = new length / original length. - Coordinate dilation: multiply x and y by the same factor.	- Do not match sides just because they look close in length. - Keep the same order on both sides of the proportion. - Use matching units in real-world problems. - Set up first; solving is usually the easier part.

My Summary

Today similarity problems start by ____

One proportion setup I can use is ____

One mistake I will avoid is ____
