

Day 07 Student Notes Overview

Geometry Summer Credit | Quadrilaterals and Coordinate Tests

Name:	Date:	Period:
-------	-------	---------

Today's Big Ideas

- Quadrilaterals can be classified by their side, angle, and diagonal properties.
- Rectangles, rhombi, and squares are special kinds of parallelograms.
- On a coordinate plane, evidence matters more than how the shape looks.

Skills I Need to Practice

- Use slope to test for parallel or perpendicular sides.
- Use distance to test for congruent sides or diagonals.
- Use midpoint to test whether diagonals bisect each other.
- Use quadrilateral properties to solve for missing lengths and angles.

Vocabulary

- parallelogram, rectangle, rhombus, square, trapezoid
- opposite sides, consecutive angles, diagonal
- parallel, perpendicular, congruent, bisect

Quick Reference

- Parallelogram: opposite sides parallel and congruent.
- Rectangle: four right angles; diagonals congruent.
- Rhombus: four congruent sides.
- Square: both rectangle and rhombus.
- Trapezoid: one pair of parallel sides.

Watch Out For

- Do not classify from appearance alone.
- One pair of parallel sides does not prove parallelogram.
- Use slope for parallel/perpendicular evidence.
- Use distance for length evidence.
- Squares belong to more than one category.

My Summary

Today I learned that...

The coordinate tool I need most is...

One mistake I will avoid is...
